**DUAL J-K FLIP-FLOPS WITH PRESET, COMMON CLOCK, AND COMMON CLEAR**

REVISED DECEMBER 1983

- Package Options Include Plastic and Ceramic DIPs
- Dependable Texas Instruments Quality and Reliability

**description**

The 'H78 and 'L78 contain two J-K flip-flops with individual J-K, preset inputs, and common clock and common clear inputs. The 'H78 and 'L78 are positive pulse-triggered flip-flops. J-K input is loaded into the master while the clock is high and transferred to the slave on the high-to-low transition. For these devices the J and K inputs must be stable while the clock is high.

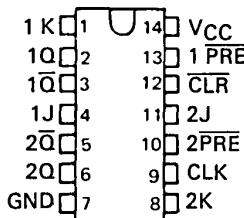

The 'LS78A contain two negative-edge-triggered flip-flops with individual J-K, preset inputs, and common clock and common clear inputs. The logic levels at the J and K inputs may be allowed to change while the clock pulse is high and the flip-flop will perform according to the function table as long as minimum setup and hold times are observed. The preset and clear are asynchronous active low inputs. When low they override the clock and data inputs forcing the outputs to the steady state levels as shown in the function table.

The SN54H78, SN54L78, and the SN54LS78A are characterized for operation over the full military temperature range of  $-55^{\circ}\text{C}$  to  $125^{\circ}\text{C}$ . The SN74H78 and the SN74LS78A are characterized for operation from  $0^{\circ}\text{C}$  to  $70^{\circ}\text{C}$ .
